Transformée de Fourier

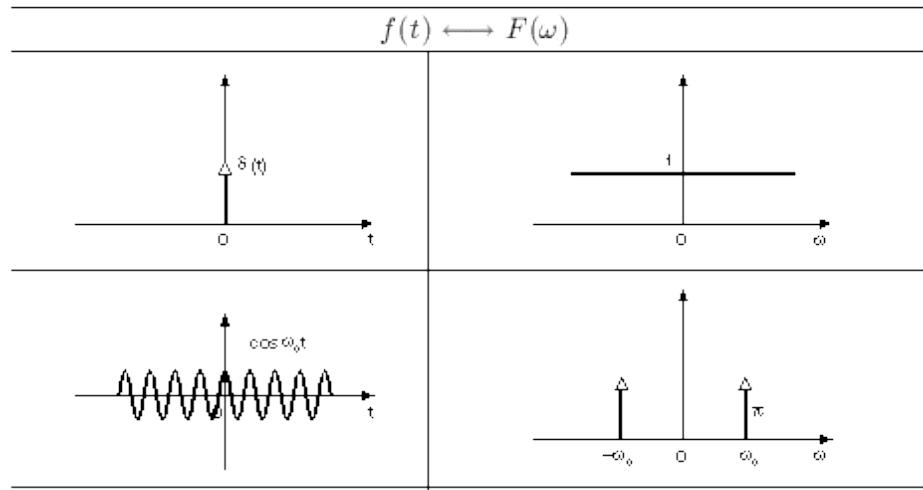

Transformée de Fourier

Transforms of singularity functions

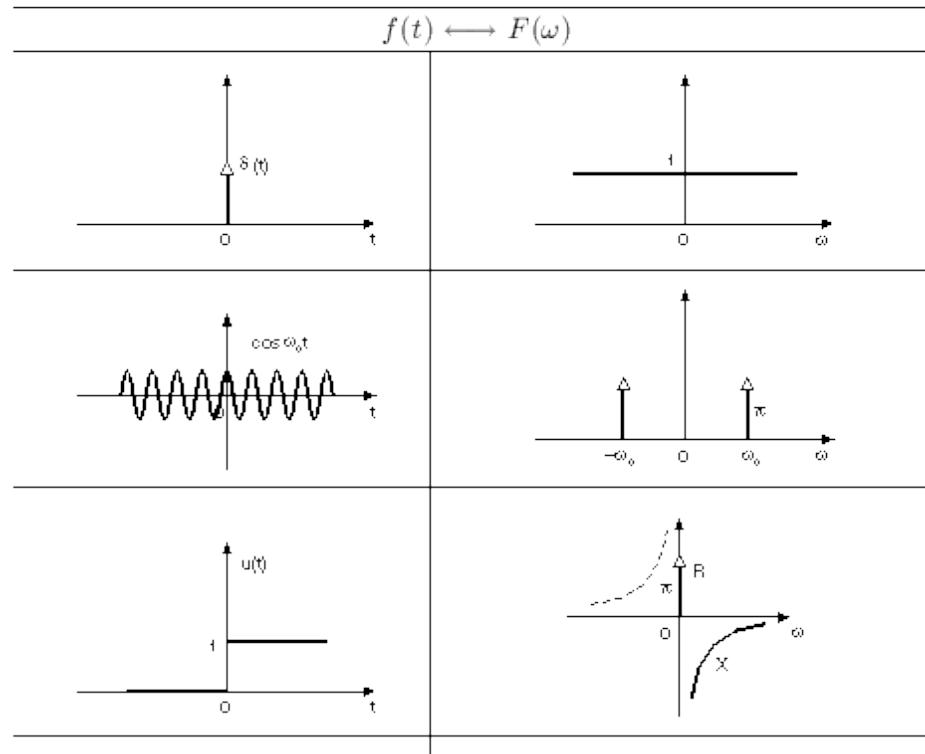

Transformée de Fourier

Transforms of singularity functions

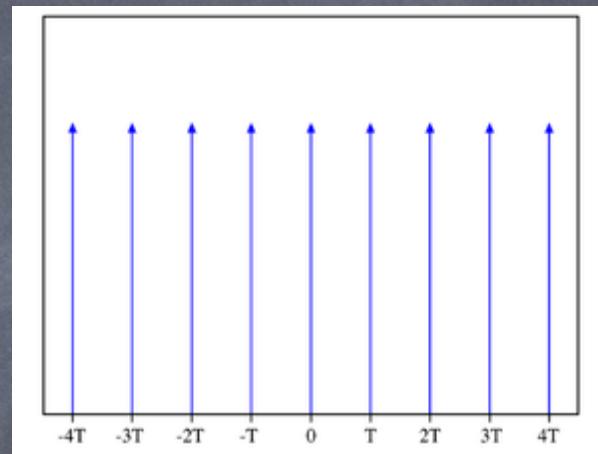

Transformée de Fourier

Transforms of singularity functions

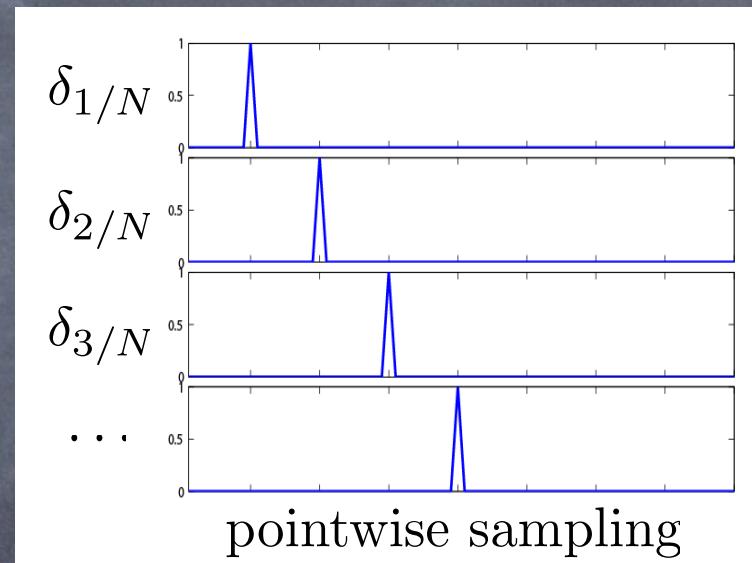

Dirac et peigne de Dirac

$$\sum_{n=-\infty}^{\infty} \delta(t - nT) \leftrightarrow \frac{1}{T} \sum_{k=-\infty}^{\infty} \delta\left(f - \frac{k}{T}\right) = \sum_{n=-\infty}^{\infty} e^{-i2\pi f nT}.$$

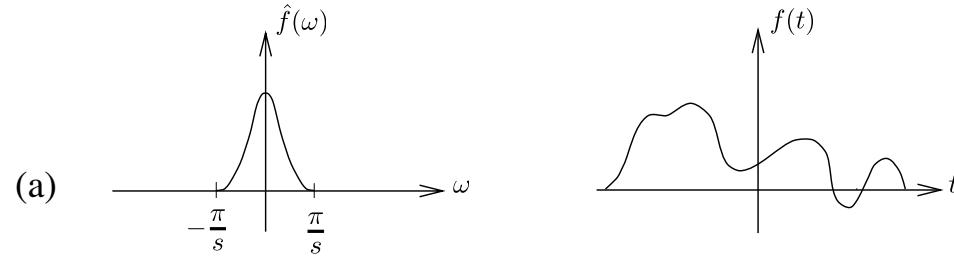

Sampling

Uniform sampling: $f[i] = f(i/N) = \langle f, \varphi_i \rangle$ where $\varphi_i = \delta_{i/N}$ Dirac.

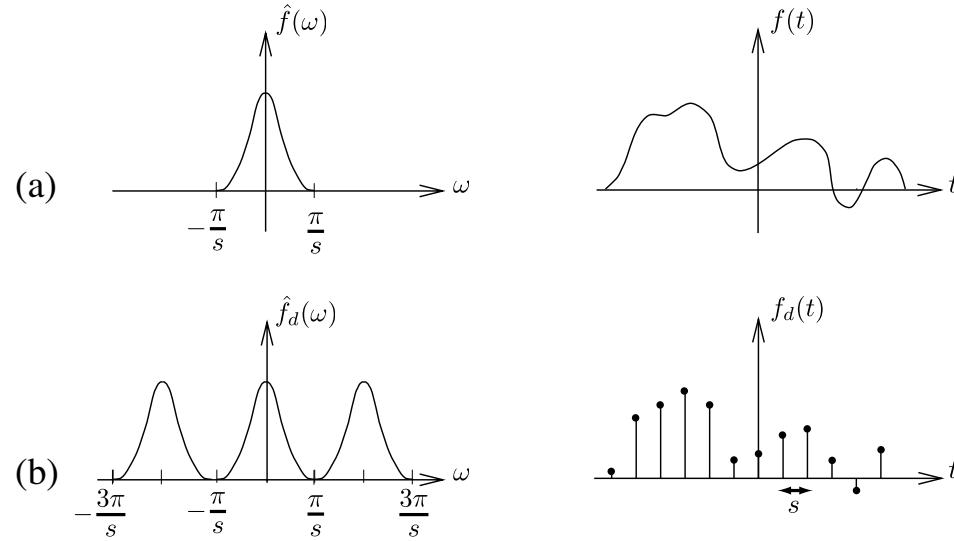

Linear reconstruction formula: $f(t) = \sum_i f[i]h(t - i/N)$ where $h(t) = \frac{\sin(\pi Nt)}{\pi Nt}$

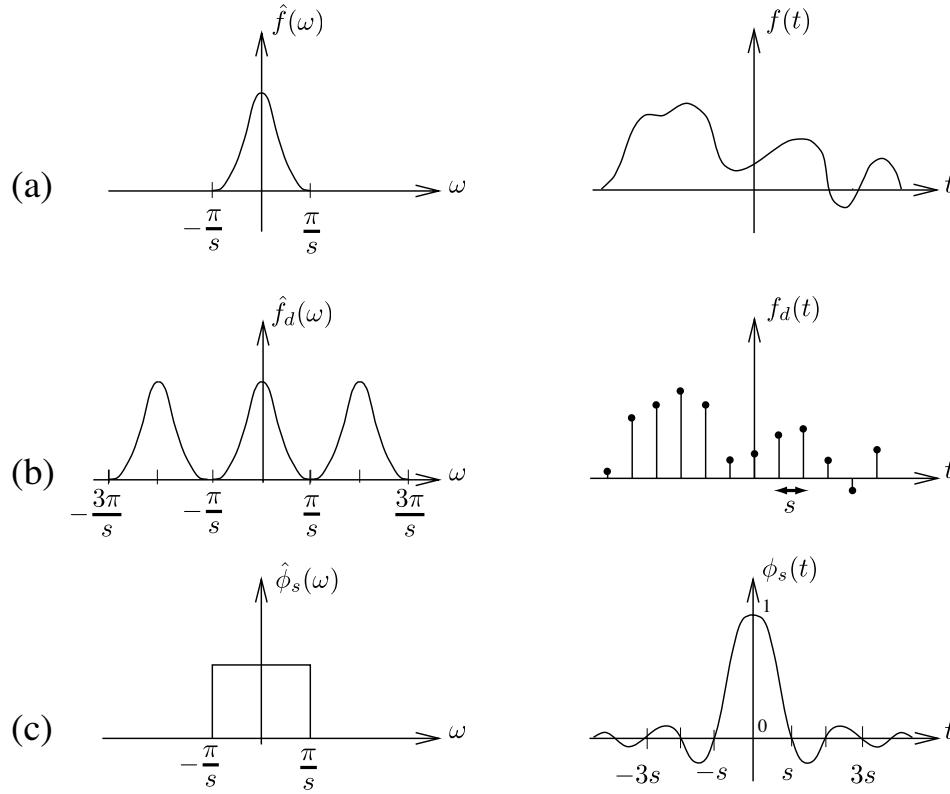

Échantillonnage

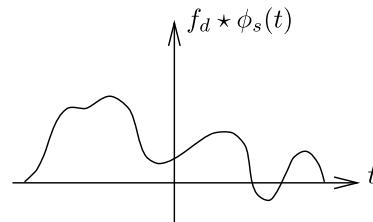

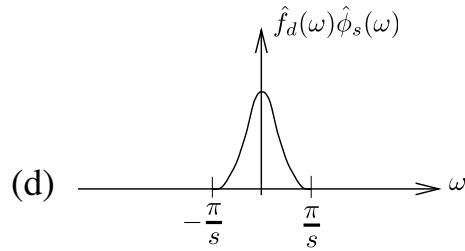

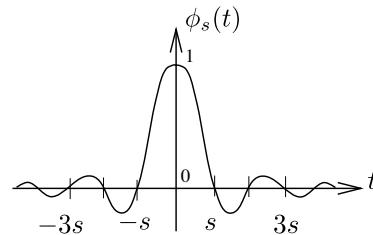

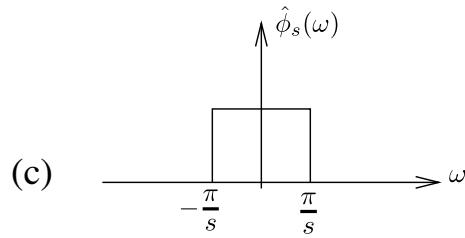

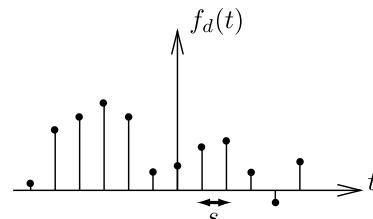

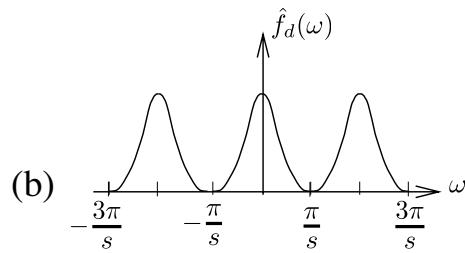

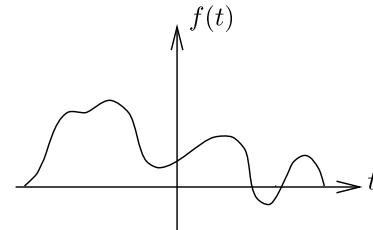

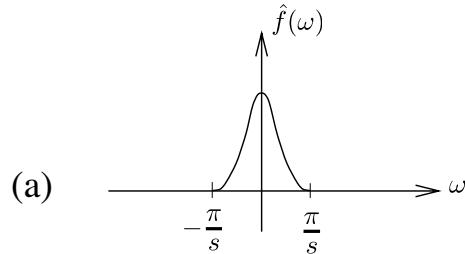

Échantillonnage

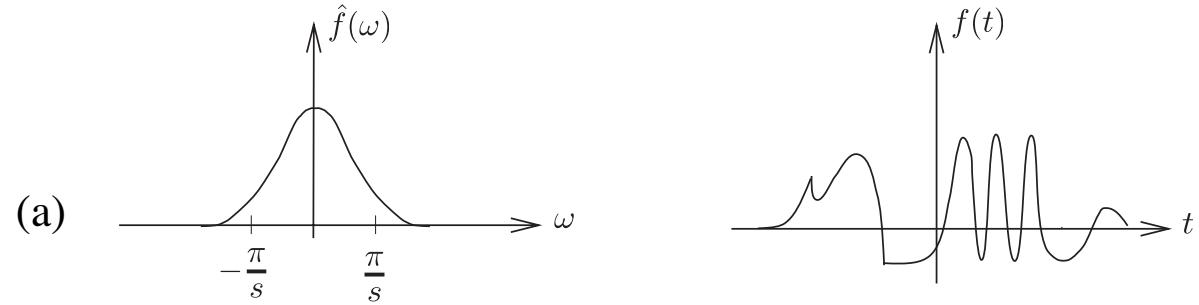

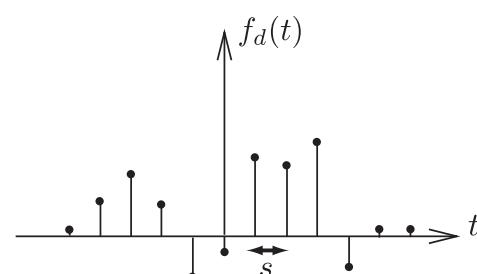

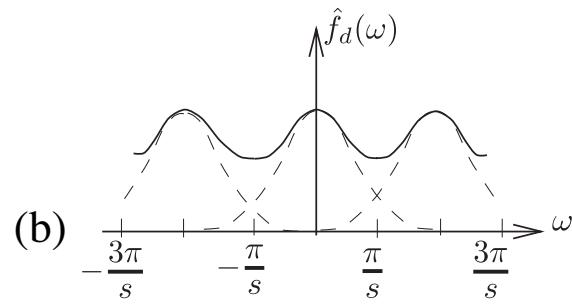

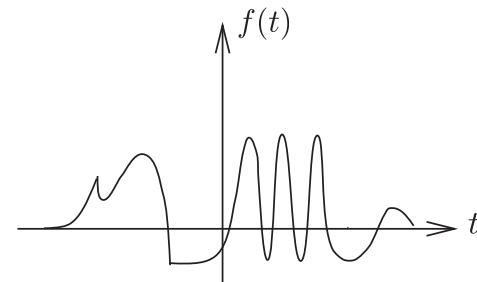

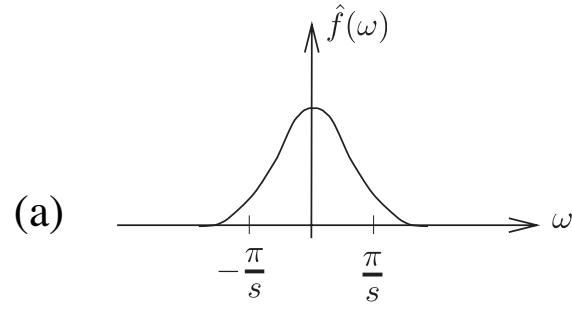

Échantillonnage

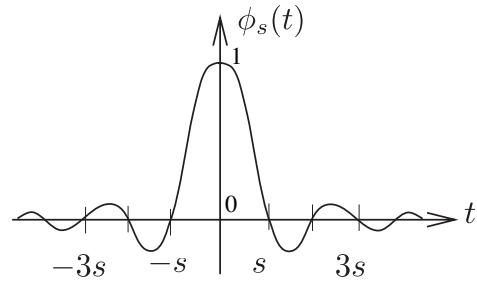

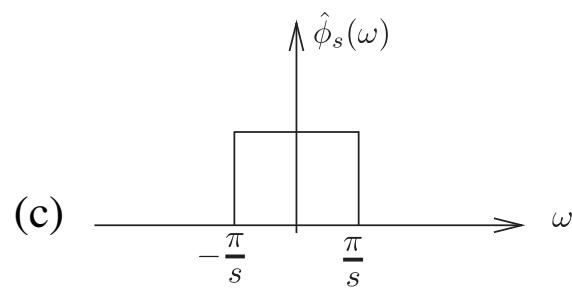

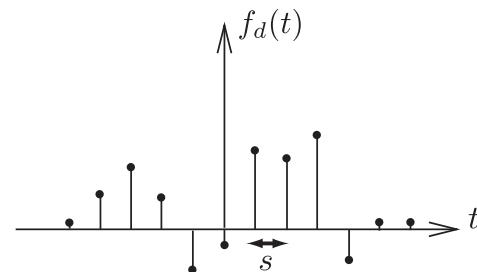

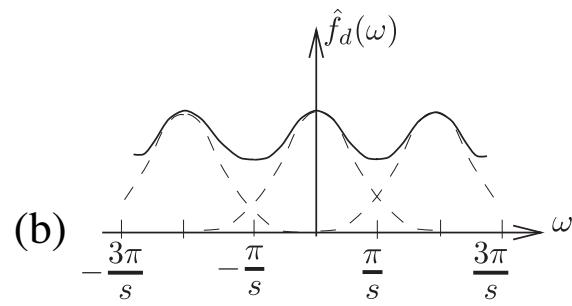

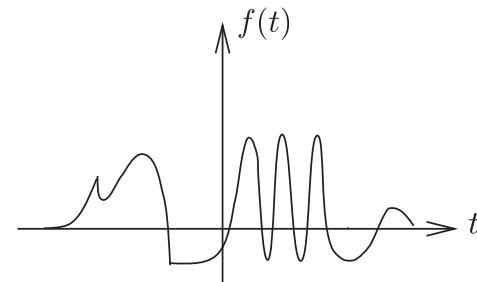

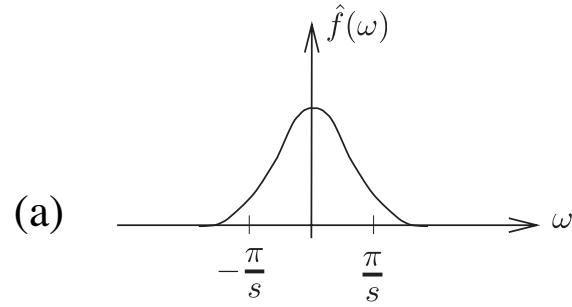

Échantillonnage

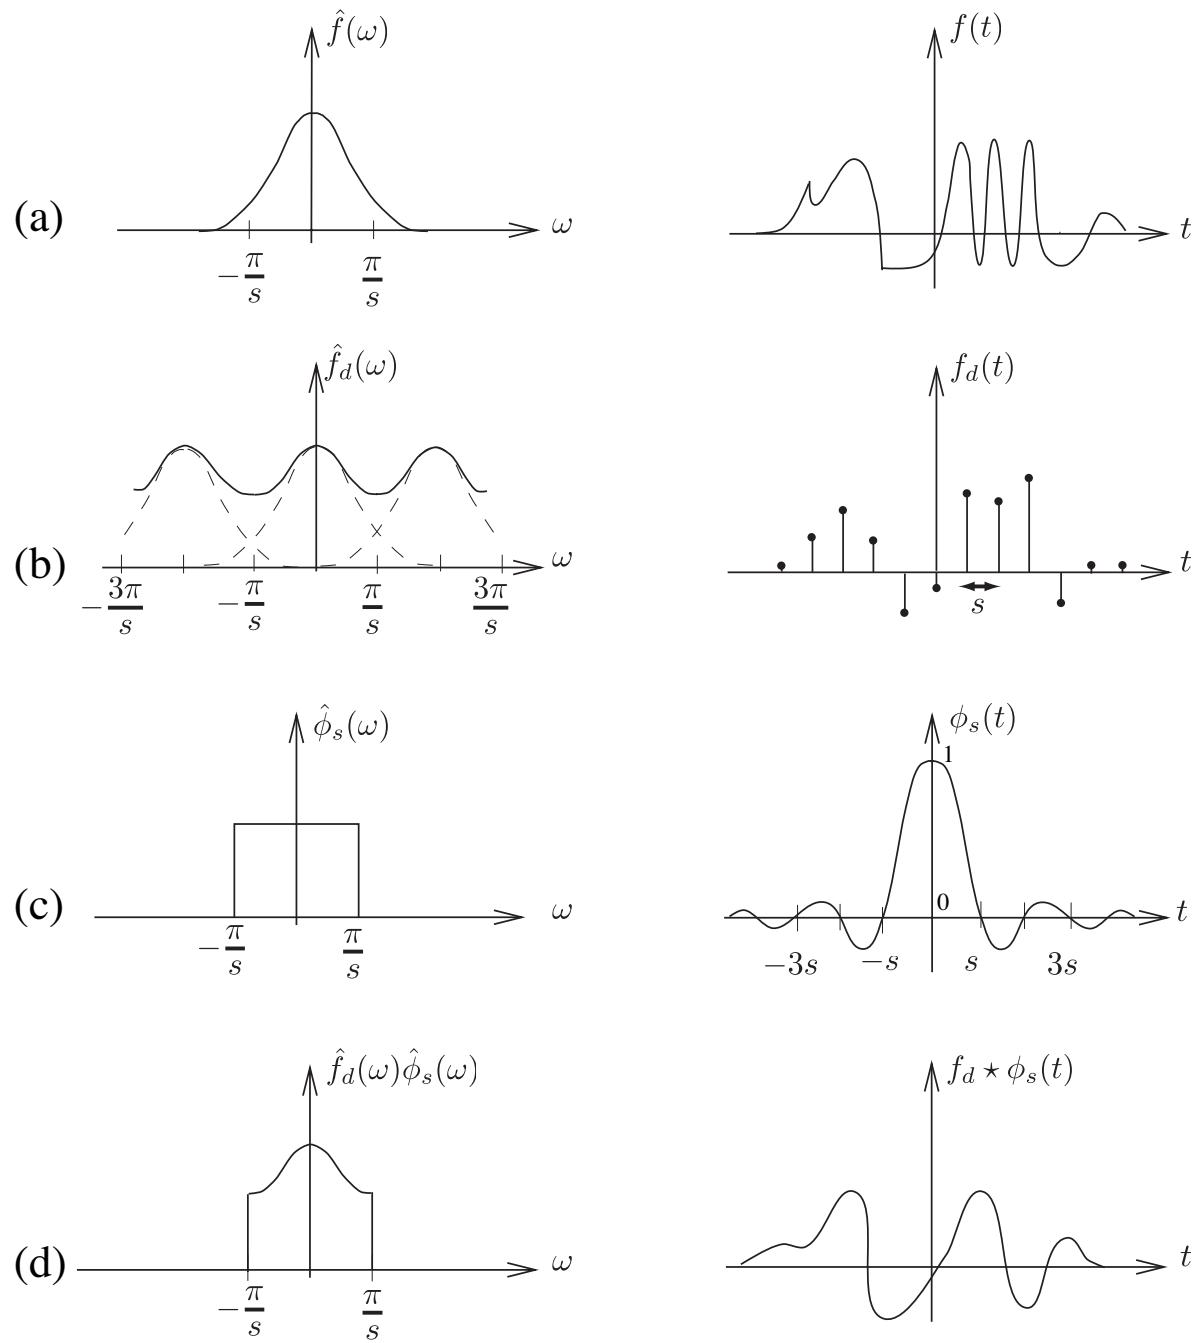

Fig. 3.2. A Wavelet Tour of Signal Processing, 3rd ed. (a): Signal f and its Fourier transform \hat{f} . (b): Aliasing produced by an overlapping of $\hat{f}(\omega - 2k\pi/s)$ for different k , shown in dashed lines. (c): Ideal low-pass filter. (d): The filtering of (b) with (c) creates a low-frequency signal that is different from f .

Thm d'échantillonnage

- La bande fréquences ($f_b = 1/ts$) qui délimitent le signal dépend de l'échantillonnage (ts)
`linspace(-2pi, 2pi, 1000)` vs `linspace(-2pi, 2pi, 100)`
- Le signal doit être contenu dans le monde des fréquences entre $-f_b/2$ et $f_b/2$
(`piece-regular` entre 0 et 1 avec 1024 points a son contenu fréquentiel entre -512 et 512)

Thm d'échantillonnage

- ➊ Donc, tant que le signal est échantillonné à $f_{max}^* 2$ (avec au moins $f_{max}^* 2 + 1$ points), il n'y aura pas de problèmes de recouvrement dans Fourier (f_{max} est la fréquence max du signal à reconstruire... qu'on ne sait pas en pratique)
- ➋ Cette fréquence critique s'appelle la fréquence de Shannon (europe) ou Nyquist (amérique)
 $f_{nyquist} = 2 * f_{max}$

Thm d'échantillonnage

- Si Nyquist/Shannon non-respecté, on a du repliement dans Fourier. Les hautes fréquences du signal se replient et viennent contaminer les basses fréquences (démo07, si on a un signal avec des cos à 3 et 8 Hz dedans mais qu'on échantillonne à 5Hz, les hautes fréquences de 8Hz se replient à 2Hz dans Fourier)

Problème d'échantillonnage

- ⦿ Repliement
- ⦿ Artéfactes de géométriques
- ⦿ Bruit
- ⦿ Interférences

Solutions TP3

- ⦿ Convolution
- ⦿ Théorème de convolution
- ⦿ Conservation d'énergie
- ⦿ Filtrage passe-bas
- ⦿ Zero-padding (interpolation linéaire)
- ⦿ Échantillonnage
